

Arcellx, Inc.

Previewing '24 catalysts + case for latemover advantage in BCMA CAR-T

Reiterate Rating: BUY | PO: 84.00 USD | Price: 70.77 USD

Reit Buy on 2024 setup ahead of key data update in 2H

Here, we preview the '24 Arcellx (ACLX) setup highlighted by anito-cel (BCMA CAR-T) pivotal data in late-line RRMM and read-through from a competitor FDA AdCom/labeling decision. Ahead of YE24 anito-cel pivotal data, we are mainly looking for confirmation of the profile established in prior Ph1/2 with delayed neuro-tox a key point of focus / differentiation. On competitor BCMA CAR-T FDA AdCom — we think the base case is for a contentious panel discussion around CAR-T OS benefit in early vs. late-line use but an ultimate vote supporting risk/benefit. Practically, KOL feedback around competitor CART safety + OS debates likely relegates CAR-T to 3L+ (for now) but we don't see negative read-across to ACLX as 3L+ is still a big market / future studies can drive push into earlier lines. We see ACLX having second-mover advantage as lead BCMA approaches continue to struggle with supply and incur the heavy/slow-lift to drive early-line adoption (see CD19 CAR-T analog). We reiterate Buy on ACLX; PO to \$84 (vs \$77 prior) on higher anito cel revenue after rebasing price assumption based on pricing for approved CAR-Ts.

2H pivotal data offer a venue for profile strengthening

We believe Arcellx/Gilead's anito-cel has established a highly competitive BCMA CAR-T profile (see report for detailed discussion). Heading into a pivotal Ph2 study update in 5L+ MM, we see further corroboration from a larger study as an important milestone both confirming anito-cel's safety differentiation + lack of efficacy trade-offs (vs. Carvykti) + improved line of sight on BLA filing/time-to-market. We believe anito-cel's delayed neurotox/parkinsonism data will be the most nuanced point: zero cases would be unequivocal, but 2+ would stir debate on differentiation vs Carvykti given variability in frequencies reported for competitor CAR-Ts. Importantly, we'd like to see near perfect manufacturing success rates vs. ~80% clinical rate for Carvykti. ACLX has not committed to when/where it will offer a Ph1/2 anito-cel updated data-cut (prior PFS within the 24-30 median PFS range vs est. of 28mo mPFS) which KOLs we have spoken with believe comfortably puts anito-cel in range to infer comparability to Carvykti.

Moving to earlier line MM: comp AdCom, ACLX's strategy

On March 15, the FDA will host an AdCom to discuss the potential label expansion of competitor CAR-Ts (Abecma, Carvykti) into earlier line MM. KOL framed line of therapy and risk/benefit of early CAR-T use vs late as possible discussion topics and flagged regulatory risk of getting 3L+ label. ACLX plans to start an earlier line MM trial in 2024 and reveal trial design in near future. See detailed AdCom preview starting on page 3.

Company Sector

Biotechnology

Company Description

Arcellx is a clinical stage biopharmaceutical company focused on the development of novel autologous CAR-T cell therapies for the treatment of cancers. The company's lead candidate, ddBCMA, is in clinical-stage for the treatment of relapse/refractory multiple myeloma (R/R MM). The company is also expecting to bring its ARC-SparX CAR-T technology into the clinic in the near term, which offers potential for a unique, differentiated approach to CAR-T treatment.

Investment Rationale

We rate Arcellx Buy and like the company based on 1) encouraging Ph1 clinical data for anito-cel (ddBCMA) which looks competitive relative to more advanced players in the relapsed/refractory multiple myeloma CAR-T space, 2) 2024 data readouts are material catalysts with potential to derisk anito-cel, and 3) upside optionality with SparX approach (we do not currently include SparX programs [early stage] in model).

ACLX'24: preliminary pivotal data in focus	5
Background: treatment algorithm, CAR-T opportunity	5
CAR-T: early vs. late MM a likely a commercial debate	6
Protracted supply constraints leave rooms for ACLX	8
Early confirmation of anito cel profile in 2H24 pivotal data	9
Appendix: data tables	12

Executive Summary

Arcellx (ACLX) is in a pivotal Ph2 trial (iMMagine-1) developing lead asset anito-cel (ddBCMA), a BCMA CAR-T, for relapsed and refractory (r/r) or 5L+ multiple myeloma (MM). Trial enrollment is ongoing and preliminary data are expected in 2H24. ACLX's prior Ph1 data indicate anito cel has competitive efficacy profile relative to standard of care, J&J/Legend's Carvykti (BCMA CAR-T), based on cross-trial comparisons of progression free survival (PFS). ACLX's Ph1 data also point to potential anito-cel differentiation vs Carvykti: 1) neuro safety – KOLs have concerns around rare but serious neurotoxicity such as Parkinsonian-like events observed with Carvykti, vs none reported in ACLX's Ph1 trial; 2) efficacy in EMD patients – anito cel appears as effective at treating EMD (extramedullary disease) patients as non-EMD patients; EMD is a subgroup of difficult to treat patients more refractory to Carvykti treatment, 3) manufacturing success rate – 100% for anito cel in ACLX's Ph1 vs 82% reported for Carvykti in clinical trial. In ACLX's 2H pivotal data, we are focused on further support for anito-cel efficacy as measured by complete response (CR) and cleaner neuro safety profile (i.e. lack of delayed neurotox and Parkinsonism) in a larger patient number (Ph2: n~110) vs prior Ph1 data (n=32 on Ph2 dose, n=38 total). In 2024, ACLX also plans to initiate a randomized controlled Ph3 trial for advancing anito cel in earlier line of MM (bigger market) and intends to disclose Ph3 trial design in near future. Prior management commentary suggest that the Ph3 would be aimed at expanding anito cel into 3L/4L plus a targeted segment of 2L. ACLX expects the studied population to be distinct than competitors' trials (KarMMa-3, Cartitude-4) but framed its trial size and corresponding addressable population would be comparable vs competitors' trials.

More near term, on March 15th, we look to FDA AdCom discussions regarding competitor BCMA CART (Carvykti + Abecma) label expansion into earlier lines of MM (2-4L). We expect BCMA CAR-Ts to secure approval in earlier lines of therapy and we believe the bigger questions are what line of therapy the treatments will be approved and where the CAR-Ts will fit into current treatment algorithm based on current data. Furthermore, we look to panelist discussion regarding whether data support the use of Carvykti early (2L) versus later (3-4L) as it remains unclear if using CAR-T earlier will lead to longer overall survival than use in later line settings. Commentary from AdCom panel might serve as a harbinger for BCMA CAR-T use in earlier lines (once supply issues are resolved) or if ongoing/future trials will be needed to drive broader use of BCMA CAR-Ts in 2L MM.

ACLX'24: preliminary pivotal data in focus

Background: treatment algorithm, CAR-T opportunity

Multiple myeloma (MM) is a cancer of plasma cells (white blood cells) in the bone marrow. Each year an est. >30k/>40k new MM cases are diagnosed in the US/EU. For newly diagnosed patients, the US treatment guideline (NCCN) recommends a Revlimid (lenalidomide)-based combo regimen followed by maintenance therapy with Revlimid. In addition to Revlimid (IMiD), a 1L induction regimen typically includes a proteasome inhibitor (PI), dexamethasone (dex), and/or an anti-CD38 antibody (e.g. Darzalex / daratumumab). There has been increased use of Darzalex in 1L based on NCCN preferential guideline recommendation for non-transplant eligible patients (~two-third of 1L MM) and recent positive Ph3 data (Perseus; dara-quadruplet [D-VRd]) in transplant-eligible pts (regulatory submission 2024E). For patients who progress on 1L therapy, a typical 2-4L regimen may include some combination of an alternative IMiD (Pomalyst / pomalidomide) with dexamethasone, a CD38, a PI, and/or other mechanisms. BCMA CAR-Ts (Abecma, Carvykti) and BCMA-directed bi-specific antibodies are approved for use in MM patients 4+ prior lines of therapy (i.e. 5L+), vs NCCN guideline recommending use of CAR-Ts and bi-specifics after 3 prior therapies (i.e. 4L+) (Exhibit 2).

In the US, we estimate the current CAR-T label indication of 5L MM+ has a US incidence of ~4k pts which translates to a US market opportunity of ~\$1.5bn, vs ~\$2.5bn global. If the category is successful in expanding its label indication into earlier line settings, we estimate 2L+ and 3L+ MM carries a \$11bn and \$6bn global market opportunity, respectively, under assumptions laid out in Exhibit 3, though in reality treatment with CARTs is unlikely to be isolated to one line of therapy (meaning practices may vary).

Exhibit 2: US treatment guideline (NCCN) for multiple myeloma (MM)

We summarize guideline-recommended treatment algorithm in MM

Line	Subgroup	Tier	Regimens	_			Me	chanism			
				IMiD	CD38	PI	Steroid	Chemo	CAR-T	Bi-specific	Other

CAR-T: early vs. late MM a likely a commercial debate

Two competitor sponsors are seeking label expansion to their CAR-T product labels (Abecma, Carvykti) into earlier line of MM. The FDA has scheduled an advisory committee (AdCom) panel for March 15th to discuss the clinical data that underpin each proposed label expansion, including overall survival (OS) data in the intended label population. We caught up with a KOL ahead of the AdCom to gauge key issues and potential read-across to ACLX's future anito-cel development in earlier line MM (Ph3 trial planned in 2024). The KOL thought the FDA panel would vote in favor of the label expansion, but would expect some difference of opinion regarding use in early vs. laterline MM. Without demonstration of an OS benefit in a crossover-allowed setting (more akin to real world), the KOL believes the clinical data to be discussed at the AdCom fail (in his view) to support that earlier use of CAR-T would lead to patients living longer vs later use, thus the commercial success of CAR-Ts may hinge on physicians' preference for how they want to sequence CAR-T in the treatment algorithm.

BCMA CAR-Ts showed PFS benefit in earlier line MM, OS benefit is an unknown

BMY (Bristol Myers Squibb) and TSVT (2seventy Bio) conducted a Ph3 trial (KarMMa-3) to evaluate Abecma (CAR-T) vs standard of care in patients who had been treated with 2-4 prior line of therapies (i.e. 3L+MM). The trial met its primary endpoint of PFS showing a 51% risk reduction (hazard ratio [HR] = 0.49) relative to physicians' choice of standard regimens (active control). There was no difference in overall survival (OS) between Abecma and control (HR=1.01) in the allcomer (ITT) population. However, 56% of patients on control arm crossed-over to receive Abecma as a subsequent therapy. Adjusting for cross-over (a pre-specified analysis), Abecma showed a better OS benefit vs control at HR=0.72.

JNJ (Johnson & Johnson) and LEGN (Legend) evaluated Carvykti (CAR-T) vs standard of care in a Ph3 trial (Cartitude-4) in patients who had been treated with 1-3 prior lines of therapies (i.e. 2L+ MM) and were refractory to lenalidomide on study entry. Unlike KarMMa-3, crossover was not allowed in Cartitude-4. The trial met its primary endpoint of PFS showing a 74% risk reduction (hazard ratio [HR] = 0.26) vs physicians' choice of standard regimens (mostly dara/poma/dex [DPd]). While OS was immature on topline results, there was an OS trend favoring Carvykti at HR=0.78. Detailed data table of KarMMa-3 and Cartitude-4 data can be found in Exhibit 9 from Appendix.

KOL framing potential discussion points at FDA AdCom

According to the FDA website, the AdCom will have general discussions focused on the "overall survival data" of Cartitude-4/KarMMa-3 and the "risk and benefit" of the respective CAR-T in the "intended population". Ahead of AdCom, we spoke with a multiple myeloma KOL at a large US academic center to gauge likely discussion points at the AdCom meeting:

Benefit of using CAR-T in early vs late line MM: the KOL lamented Cartitude-4/KarMMa-3 did not inform early use of CAR-Ts would lead to patients ultimately living longer throughout their cancer (through any subsequent therapies till death)

as opposed to reserving CAR-T for later use, a scenario mirrored in patients from the control arm crossing over to receive CAR-T as a subsequent therapy. More specifically, in KarMMa-3, Abecma did not lead to better OS benefit vs control in allcomer population without adjusting for crossover. In Cartitude-4, immature OS data favor Carvykti vs control, but the trial did not allow crossover thus not designed the ultimate question on early vs late CAR-T usage. Said differently, if the physician can give CART in a later line (akin to the cross-over group) with comparable OS, then why subject the patient to CART related toxicities. The KOL pointed to Yescarta (CD19 CAR-T) as an example for "persuasive" OS benefit in 2L DLBCL (lymphoma; ZUMA-7 data) demonstrating OS benefit while allowing control arm to receive CAR-T as a subsequent therapy. While K-3/C-4 trials showed significant PFS benefit vs control, it is unclear how early use of CAR-T would impact a patient's PFS outcome on subsequent therapies following CAR-T treatment.

- Risks of using CAR-T in early vs late line MM: the KOL thought the safety risks of CAR-Ts could be a discussion topic as it pertains to risk/benefit of using CAR-T, which carries a higher degree of scrutiny vs late line MM. Earlier line patients can live a number of years on effective treatment, thus quality of life matters more in earlier line MM. Among safety signals associated with CAR-Ts, the KOL is most concerned around rare but serious neurotoxicity such as Parkinsonism (more specific to Carvykti), as well as negative impacts to the bone marrow given some patients may have prolonged cytopenia post CAR-T, which could make giving subsequent therapies worse for those patients. Lastly, while the rate of grade 3 CRS reported were relatively low (<5%) in clinical trials, a potential need for a visit to intensive care (ICU) is not ideal for patients.
- Patient baseline of Cartitude-4 in the context of evolving 1L landscape: the KOL framed exposure to prior a CD38 antibody (e.g. Darzalex) in Cartitude-4 could be a topic of discussion. There has been an increasing use of Darzalex in 1L setting based on NCCN guideline and emerging clinical data of Darzalex. Only a quarter of Cartitude-4 patients enrolled had been exposed to a CD38 antibody, vs 100% of patients had prior exposure to Darzalex in KarMMa-3. We note in Cartitude-4 PFS favors Carvykti over control in dara-naïve and dara-exposed subgroups.
- Line of therapy study population vs label: the KOL framed line of therapy for the drug label could be a discussion topic, given the majority (67-68%) of patients enrolled in Cartitude-4 had received 2 or more prior therapies (i.e. 3L+) (Exhibit 9). Recall, Cartitude-1 enrolled patients who had been treated with 3+ prior lines of therapy (i.e. 4L+), though Carvykti received a 5L+ label with FDA review documents citing establishment of risk/benefit in latter line population given only 17% of trial subjects were 4L vs majority were 5L+ in Cartitude-1. On the other hand, we note in Cartitude-4 PFS favors Carvykti over control in both 2L and 3-4L subgroups.
- Composition of the AdCom panel may influence tone of discussions: the KOL
 thought transplant and CAR-T specialists could be more supportive on CAR-T label
 expansion into earlier line MM, whereas multiple myeloma physicians could be more
 skeptical on earlier use of CAR-T in treatment algorithm, given neither KarMMa-3
 nor Cartitude-4 data confirmed patients would live longer if they receive CAR-T
 earlier in disease course vs later.
- AdCom panelist discussions may provide early insights on commercial prospects: the KOL believes the FDA would more likely than not approve Abecma and Carvykti according to the KarMMa-3 and Cartitude-4 study populations as these trials met the primary PFS endpoint, thus leaving the physician community to decide best use of CAR-T in the treatment algorithm. The KOL predicts the CAR-Ts will mainly be used in 3L-4L setting based on the study results, whereas lack of OS benefit raises questions on risk/benefit for use in 2L and late-line patients (5L+)

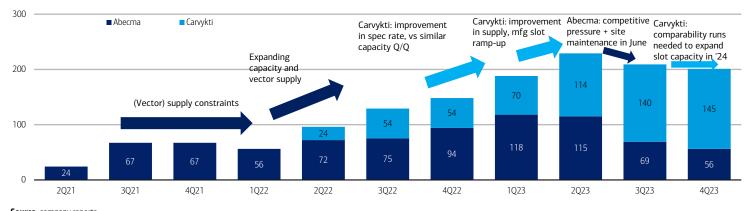

may be suboptimal for CAR-T cell production. The KOL cited Yescarta as an analog where commercial barrier to CD19 CAR-T remains in 2L+ DLBCL (community physicians' resistance to CAR-T referral) ~2 years after label expansion despite superior OS benefit demonstrated in the ZUMA-7 trial. Gilead recently noted that cell therapy penetration was ~15% in 2L+ DLBCL vs ~30% in EU, citing more gradual adoption by community physicians (80% of market) in the US.

Protracted supply constraints leave rooms for ACLX

Currently, CAR-T manufacturers cannot produce sufficient CAR-T products to address market demand in 4L/5L+ MM. Quarterly net sales of Carvykti were lumpy in 2023 as J&J/Legend continued to expand manufacturing (mfg) capacity for Carvykti, whereas sales of Abecma had slowed due to competitive pressure from BCMA-targeted therapies (e.g. Carvykti) (Exhibit 4). We estimate ~1.8k commercial doses of Abecma and Carvykti were made in the US (annualized rate based on 4Q23 reported net sales), vs. 3-4k eligible CAR-T patients. Penetration in ex-US is very low, as we estimate ~800 dose provided to ex-US patients vs est. >5k eligible patients in EU without counting patients rest of world.

Exhibit 4: US sales of BCMA CAR-T since commercial launches (\$m)Mfg constraints had limited uptake of BCMA CAR-Ts during initial launch phase

Source: company reports

BofA GLOBAL RESEARCH

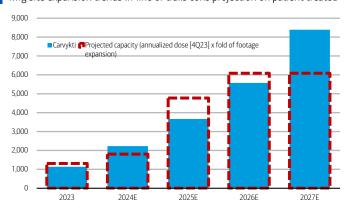

While ongoing efforts for CAR-T mfg expansion should address supply constraints in 5L+MM, the bigger question is whether JNJ/LEGN and BMY/TSVT can address increasing demand assuming their respective CAR-Ts will be approved for use in earlier line MM. While ACLX is late on timeline with 5L+ launch expected in 2026 (vs earlier line probably in 2028E+ timeframe based on KarMMa-3/Cartitude-4 timeline), persistent supply constraints should create an opportunity for late mover like ACLX to catch up in our view. By our estimates, it is unlikely that any one single manufacturer would be able to address demand if CAR-Ts become broadly used if not become standard of care in 3L or earlier line MM. We can look at this issue in a couple of different ways:

Market size in earlier line MM exceeds market leader's aspirational goal on CAR-T capacity: JNJ/LEGN had aspired to be in position to produce 10k commercial doses a year by 2026E, which compare to estimated ~8k/~9k US eligible patients in the US/EU in 3L vs ~15k/~17k in 2L. Beyond Cartitude-4 for 2L+ MM, JNJ/LEGN look to expand Carvykti into 1L with Ph3 trials ongoing (Cartitude-5 [non-transplant candidate], Cartitude-6 [transplant eligible]). Primarily completion date for Cartitude-5 is expected to be June 2026.

Market lead must catch up on mfg expansion to catch up on aspirational production goal and consensus sales estimate: JNJ/LEGN's production scale of Carvykti is annualizing at ~1.5k dose per year (based on 4Q23 reported sales). Assuming JNJ/LEGN can replicate the mfg efficiency from current cell processing location at Raritan, NJ to new mfg sites expected to come online over the next few years (expected to provide 3.5-4x square foot as current Raritan footprint), current annualized rate of Carvykti production would imply a capacity of around 6k dose per year by 2026E, by our estimates. Getting to JNJ/LEGN's aspirational goal (10k doses / year) and (JNJ) consensus estimates (8.5k doses in 2027) would require further manufacturing slot expansion in current Raritan NJ site and have that capacity replicated in other new sites. For more in-depth discussions on CAR-T manufacturing, please see our CAR-T mfg primer report.

Early confirmation of anito cel profile in 2H24 pivotal data

In 2H24, ACLX plans to provide preliminary data from the ongoing pivotal trial of anito cel in 5L+ MM (iMMagine-1). At a high level, our focus for the 2H update is on additional support for anito cel's efficacy and safety profile in a larger sample size than prior Ph1 data (n=32). For context, ACLX's Ph1 data update of anito cel in 5L+ MM at ASH 2023 indicated anito cel has competitive efficacy profile vs Carvykti based on cross-trial comparisons of durability measures such as median PFS and PFS rates. The Ph1 clinical data also suggest anito cel may have potential differentiation vs Carvykti: 1) neuro safety, 2) efficacy in EMD patient subgroup, 3) manufacturing process. Detailed cross-trial comparison data table for 5L+ MM can be found in Exhibit 10 in the Appendix.

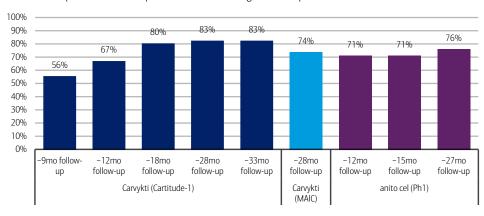

The iMMagine-1 trial is enrolling patients, with an enrollment target of ~110 patients. ACLX expects the 2H update to feature a robust sample size at complete enrollment (n~110), with a focus on complete response and MRD- (minimal residual disease) similar to initial Ph1 data of anito cel given duration of patient follow-up. On patient baseline, ACLX framed the pivotal trial would be more comparable to Cartitude-1 than ACLX's Ph1 trial, e.g. iMMagine-1 is expected to feature younger demographics and less EMD patients. Enrolling less-sick patients in iMMagine-1 would position anito cel to at least maintain efficacy profile relative to ACLX's prior Ph1 data. For the 2H update, we are most focused on complete response rate (CR), safety profile including neuro safety, and

robustness of ACLX's manufacturing success rate. Conversely, we do not expect duration of follow-up to be sufficiently long enough to interrogate PFS data in allcomer and EMD patient until a future update.

• Complete response: in lieu of PFS updates given duration of follow-up expected by 2H, we will look for a CR rate in the 60-70% range depending on where duration of follow-up lands by the time of datacut. As a reminder, with Cartitude-1, JNJ/LEGN had presented the data with five different data-cuts with CRs deepening over time. We note the 60%-70% CR range would compare to Carvykti's 56% in first datacut (8.8mo follow-up) and Carvykti's 67% in in second datacut (12.4mo follow-up), as well as anito-cel's 71% CR in initial Ph1 data (12.1mo follow-up). CR of that magnitude would offer initial confirmation of anito cel's efficacy profile in a larger sample size (up to n~110) vs Ph1 data (n=32), pending confirmation of durability metrics (median PFS) in a future update.

Exhibit 7: Complete response (CR) rates for CAR-Ts in 5L+MM CR rates from prior Ph1 data deepened over time on longer follow-up

Source: company reports

BofA GLOBAL RESEARCH

- Neuro safety: we will look for a neuro toxicity rate no higher than 3% and no reports (or no more than 1 case) of delayed neurotoxicity or Parkinsonian-like events in Ph2 data. Zero case of delayed neurotox will offer the cleanest comp vs Carvykti which had reports of delayed neurotox ranging from low single digit to 5% between Cartitude-1 and Cartitude-4, whereas 1 case (out of ~110 Ph2 patients + 38 Ph1 patients [across both doses]) would still compare favorably to the low end of the AE frequency range reported for Carvykti. ACLX believes the 2H update will be informative on neuro tox based on expected duration of follow-up relative to onset of neurotoxicity seen with Carvytki (label: median onset 43d, range 15-108 days). While rate of neurotoxicity for Carvykti was lower at ~3% in Cartitude-4 (2L+ MM), KOLs framed the primary neuro safety concern on Carvykti lies in the rare but serious neurotoxicity such as Parkinsonism as these events are not transient, potentially irreversible, and lack effective remediation options. See below for a more detailed discussion on neurotox associated with CAR-T.
- Manufacturing success: ACLX was able to manufacture anito cel successfully in all 40 patients who had been enrolled and apheresed in Ph1. We look to confirm the robust mfg success rate (e.g. >90%) in a larger sample size in Ph2, but so far mfg metrics in Ph1 compare favorably to the clinical mfg success rate of Carvytki from Cartitude-1 (82%). ACLX's current mfg process (through a contract manufacturer) for Ph2 is the same as Ph1, whereas tech transfer of the mfg process to partner Gilead/Kite is ongoing and expected to complete this year. ACLX expects Kite's

process/expertise can offer better turnaround time than current process (Ph1: 35d median), possibly ballparks that for Yescarta (14-16d median), with similar mfg success rate as current process. Manufacturing success rate and turnaround time are important commercial factors because 1) a sponsor can only recognize revenue from an in-specification (in spec) CAR-T, 2) KOLs we spoke with consistently emphasize that they desire an effective CAR-T that they can obtain reliably and timely vs there remains supply constraints for Carvykti in 5L+ MM.

Below, we summarize PFS and EMD data of anito cel in prior Ph1, though we look to a future update post-2024 for better Ph2 characterization of anito cel.

- Durability of efficacy by mPFS and PFS rates: anito cel has an estimated median (m) PFS of ~28mo and a 24mo PFS rate of 56%, which stack up well against Carvytki which had shown similar data in a key benchmark study, an MAIC (matching adjusted indirect comparison)-adjusted analysis of Cartitude-1: ~25mo mPFS, low 50%'s 24-month PFS.
- **Efficacy in EMD patient subgroup**: patients with extramedullary disease (EMD) were more refractory to Abecma or Carvykti CAR-T treatments in clinical trials. In respective 5L+ MM trials, EMD patients had shorter mPFS compared to allcomers. More specifically in Cartitude-1, Carvykti showed a mPFS of 13-14 months in EMD compared to 34-35mo mPFS (not MAIC-adjusted) in allcomers. By comparison, in ACLX's Ph1 trial, anito cel's mPFS was not reached in both EMD and allcomers at 26.5mo follow-up and 24mo PFS rates were 56-58% for both EMD and allcomers. ACLX's Ph1 data suggest anito cel may work as effectively in EMD as non-EMD patients, though the observation needs to be validated in a bigger sample size (vs n=13 EMD patients in Ph1). Our discussion here is focused on PFS, as it is clear to us whether CAR-T would induce different CR rate in EMD vs non-EMD patients, given limited disclosure from sponsors (Exhibit 10), except in Legend-2 CR rate for Carvykti was lower in EMD subgroup vs allcomer (55% vs 73%). Nonetheless, by definition, we note EMD lesions must be cleared for a patient to qualify as a CR. Our prior KOL checks suggest a scenario where physicians may gravitate toward anito cel over alternatives knowing it works in EMD patients without worrying about doing additional diagnostic work to determine a patient has EMD or not (EMD is underdiagnosed in real world per KOL checks).

Neurotoxicity: a safety event of interest for CAR-T therapy

Neurotoxicity is a possible adverse event that occurs in patients after CAR-T treatment, which generally happens as a 'by-product' of cytokine release syndrome (CRS; another AE) and onset is typically within a couple of weeks after CAR-T treatment. These neuro signals are documented as ICANS (immune effector cell-associated neurotoxicity syndrome) in clinical trials and are generally reversible. Some patients may develop delayed neurotoxicity around 1-3 months after CAR-T treatment that are relatively rare in occurrence but potentially serious / protracted enough to significantly impact the patient's quality of life. Delayed neurotox may include cranial nerve palsy and Parkinsonian-like symptoms (e.g. movement disorder). Per our KOL checks, the underlying cause of the delayed neurotoxicity is not entirely clear, and these adverse events are typically not transient, potentially irreversible, and often lack effective remediation options.

Delayed neurotoxicity adverse events have been reported in different CAR-T therapies, but the AE incidence rate appears most pronounced with Carvykti. In the Cartitude-1 trial (4L+ MM, n=97), ~10% of Carvykti-treated patients reported to have grade 3 neurotoxicity AE and majority of them or 9% of patients had non-ICANS toxicity that has later onset of action (delayed neurotox). Of those, 4 patients had Parkinsonism, including three grade 3/4 cases. By comparison, incidence of grade 3+ delayed neurotox was was

lower in Cartitude-4 (2L+ MM) at ~3% or less; hypotheses for lower incidence of grade 3+ neurotox include 1) Carvykti may be better tolerated in earlier line, 2) more effective bridging therapy reducing tumor burden prior to CAR-T treatment, 3) risk-mitigation strategies. KOLs we spoke with are primarily concerned around the protracted and potentially irreversible nature of delayed neurotoxicity (even if rare in occurrence).

ACLX believes anito cel would likely ballpark Abecma on frequency of neurotoxicity and delayed neurotox in larger sample size. Incidence of delayed neurotox was perceived to be less frequent for Abecma than Carvykti per our KOL checks (based on clinical data and real world experience). Further, Abecma label lacks warning language on Parksonism in boxed warning whereas Carvykti label does. In both KarMMa (4L+ MM) and KarMMa-3 (3L+ MM), around 3% of Abecma-treated patients had grade 3 neurotox but there was no case of Parkinsonism reported in either trial. According to FDA review documents, one case of grade 4 cerebral edema, one case of grade 3 myelitis and one case of grade 3 Parkinsonism have occurred in other studies submitted as part of the initial BLA (drug application). These three cases collectively represent <1% of ~500 Abecma-treated patients included in the initial BLA package (4L+ MM) + KarMMa-3 (3L+ MM) by our math.

BofA GLOBAL RESEARCH

Price objective basis & risk

Arcellx, Inc. (ACLX)

Our \$84 per share price objective is based on a risk-adjusted, sum-of-the-parts DCF. We assume 1) a discount rate of 10% for a pivotal clinical-stage company, 2) a Probability of Success of 80% for ddBCMA program given that it will soon enter pivotal testing. 3) terminal value with terminal growth rate of 0% to reflect a durable market position for ddBCMA given high capital barriers to competitor entry

Downside risks are: 1) ddBCMA trial failure, 2) worse-than-expected ddBCMA clinical data

Upside risks are: 1) better-than-expected ddBCMA clinical data and 2) acquisition at a premium.

Free Cash Flow Yield	Cash Flow From Operations – Total Capex	Market Cap = Current Share Price × Current Basic Shares
Enterprise Value / Sales	EV = Current Share Price × Current Shares + Minority Equity + Net Debt + Other LT Liabilities	Sales

EV / EBITDA Enterprise Value Basic EBIT + Depreciation + Amortization

Menethod 3*is the set of BofA Global Research standard measures that serve to maintain global consistency under three broad headings: Business Performance, Quality of Earnings, and validations. The key features of iQmethod are: A consistently structured, detailed, and transparent methodology. Guidelines to maximize the effectiveness of the comparative valuation process, and to identify some common pitfalls.

Redatabase is our real-time global research database that is sourced directly from our equity analysts' earnings models and includes forecasted as well as historical data for income statements, balance sheets, and cash flow statements for companies covered by BofA Global Research.

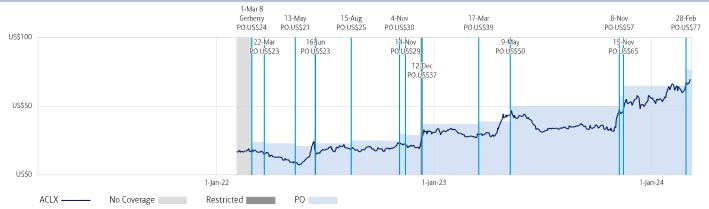

*IQ*profileSM, *IQ*methodSM are service marks of Bank of America Corporation. *IQ*database[®] is a registered service mark of Bank of America Corporation.

Arcellx (ACLX) Price Chart

B: Buy, N: Neutral, U: Underperform, PO: Price Objective, NA: No longer valid, NR: No Rating

The Investment Opinion System is contained at the end of the report under the heading "Fundamental Equity Opinion Key". Dark grey shading indicates the security is restricted with the opinion suspended. Medium grey shading indicates the security is under review with the opinion withdrawn. Light grey shading indicates the security is not covered. Chart is current as of a date no more than one trading day prior to the date of the report.

Equity Investment Rating Distribution: Health Care Group (as of 31 Dec 2023)

Coverage Universe	Count	Percent	Inv. Banking Relationships R1	Count	Percent
Buy	234	60.94%	Buy	115	49.15%
Hold	80	20.83%	Hold	36	45.00%
Sell	70	18.23%	Sell	29	41.43%

Equity Investment Rating Distribution: Global Group (as of 31 Dec 2023)

Coverage Universe	Count	Percent	Inv. Banking Relationships R1	Count	Percent
Buy	1895	53.62%	Buy	1083	57.15%
Hold	832	23.54%	Hold	454	54.57%
Sell	807	22.84%	Sell	383	47.46%

R1 Issuers that were investment banking clients of BofA Securities or one of its affiliates within the past 12 months. For purposes of this Investment Rating Distribution, the coverage universe includes only stocks. A stock rated Neutral is included as a Hold, and a stock rated Underperform is included as a Sell.

FUNDAMENTAL EQUITY OPINION KEY: Opinions include a Volatility Risk Rating, an Investment Rating and an Income Rating. VOLATILITY RISK RATINGS, indicators of potential price fluctuation, are: A - Low, B - Medium and C - High. INVESTMENT RATINGS reflect the analyst's assessment of both a stock's absolute total return potential as well as its attractiveness for investment relative to other stocks within its Coverage Cluster (defined below). Our investment ratings are: 1 - Buy stocks are expected to have a total return of at least 10% and are the most attractive stocks in the coverage cluster; 2 - Neutral stocks are expected to remain flat or increase in value and are less attractive than Buy rated stocks and 3 - Underperform stocks are the least attractive stocks in a coverage cluster. An investment rating of 6 (No Rating) indicates that a stock is no longer trading on the basis of fundamentals. Analysts assign investment ratings considering, among other things, the 0-12 month total return expectation for a stock and the firm's guidelines for ratings dispersions (shown in the table below). The current price objective for a stock should be referenced to better understand the total return expectation at any given time. The price objective reflects the analyst's view of the potential price appreciation (depreciation).

Investment rating Total return expectation (within 12-month period of date of initial rating) Ratings dispersion guidelines for coverage cluster^{R2}

Buy	≥ 10%	≤ /0%
Neutral	≥ 0%	≤ 30%
Jnderperform	N/A	≥ 20%

R2Ratings dispersions may vary from time to time where BofA Global Research believes it better reflects the investment prospects of stocks in a Coverage Cluster.

INCOME RATINGS, indicators of potential cash dividends, are: 7 - same/higher (dividend considered to be secure), 8 - same/lower (dividend not considered to be secure) and 9 - pays no cash dividend. Coverage Cluster is comprised of stocks covered by a single analyst or two or more analysts sharing a common industry, sector, region or other classification(s). A stock's coverage cluster is included in the most recent BofA Global Research report referencing the stock.

Price Charts for the securities referenced in this research report are available on the Price Charts website, or call 1-800-MERRILL to have them mailed.

BofAS or one of its affiliates acts as a market maker for the equity securities recommended in the report: Arcellx.

The issuer is or was, within the last 12 months, an investment banking client of BofAS and/or one or more of its affiliates: Arcellx.

BofAS or an affiliate expects to receive or intends to seek compensation for investment banking services from this issuer or an affiliate of the issuer within the next three months: Arcellx. BofAS or one of its affiliates is willing to sell to, or buy from, clients the common equity of the issuer on a principal basis: Arcellx.

BofA Global Research personnel (including the analyst(s) responsible for this report) receive compensation based upon, among other factors, the overall profitability of Bank of America Corporation, including profits derived from investment banking. The analyst(s) responsible for this report may also receive compensation based upon, among other factors, the overall profitability of the Bank's sales and trading businesses relating to the class of securities or financial instruments for which such analyst is responsible.

U

Other Important Disclosures

From time to time research analysts conduct site visits of covered issuers. BofA Global Research policies prohibit research analysts from accepting payment or reimbursement for travel expenses from the issuer for such visits.

Prices are indicative and for information purposes only. Except as otherwise stated in the report, for any recommendation in relation to an equity security, the price referenced is the publicly traded price of the security as of close of business on the day prior to the date of the report or, if the report is published during intraday trading, the price referenced is indicative of the traded price as of the date and time of the report and in relation to a debt security (including equity preferred and CDS), prices are indicative as of the date and time of the report and are from various sources including BofA Securities trading desks.

The date and time of completion of the production of any recommendation in this report shall be the date and time of dissemination of this report as recorded in the report timestamp.

Recipients who are not institutional investors or market professionals should seek the advice of their independent financial advisor before considering information in this report in connection with any investment decision, or for a necessary explanation of its contents.

Officers of BofAS or one or more of its affiliates (other than research analysts) may have a financial interest in securities of the issuer(s) or in related investments. Refer to BofA Global Research policies relating to conflicts of interest.

'BofA Securities' includes BofA Securities, Inc. ('BofAS') and its affiliates. Investors should contact their BofA Securities representative or Merrill Global Wealth Management financial advisor if they have questions concerning this report or concerning the appropriateness of any investment idea described herein for such investor. 'BofA Securities' is a global brand for BofA Global Research.

General Investment Related Disclosures:

Taiwan Readers: Neither the information nor any opinion expressed herein constitutes an offer or a solicitation of an offer to transact in any securities or other financial instrument. No part of this report may be used or reproduced or quoted in any manner whatsoever in Taiwan by the press or any other person without the express written consent of BofA Securities. This document provides general information only, and has been prepared for, and is intended for general distribution to, BofA Securities clients. Neither the information nor any opinion expressed constitutes an offer or an invitation to make an offer, to buy or sell any securities or other financial instrument or any derivative related to such securities or instruments (e.g., options, futures, warrants, and contracts for differences). This document is not intended to provide personal investment advice and it does not take into account the specific investment objectives, financial situation and the particular needs of, and is not directed to, any specific person(s). This document and its content do not constitute, and should not be considered to constitute, investment advice for purposes of ERISA, the US tax code, the Investment Advisers Act or otherwise. Investors should seek financial advice regarding the appropriateness of investing in financial instruments and implementing investment strategies discussed or recommended in this document and should understand that statements regarding future prospects may not be realized. Any decision to purchase or subscribe for securities in any offering must be based solely on existing public information on such security or the information in the prospectus or other offering document issued in connection with such offering, and not on this document.

Securities and other financial instruments referred to herein, or recommended, offered or sold by BofA Securities, are not insured by the Federal Deposit Insurance Corporation and are not deposits or other obligations of any insured depository institution (including, Bank of America, N.A.). Investments in general and, derivatives, in particular, involve numerous risks, including, among others, market risk, counterparty default risk and liquidity risk. No security, financial instrument or derivative is suitable for all investors. Digital assets are extremely speculative, volatile and are largely unregulated. In some cases, securities and other financial instruments may be difficult to value or sell and reliable information about the value or risks related to the security or financial instrument may be difficult to obtain. Investors should note that income from such securities and other financial instruments, if any, may fluctuate and that price or value of such

securities and instruments may rise or fall and, in some cases, investors may lose their entire principal investment. Past performance is not necessarily a guide to future performance. Levels and basis for taxation may change.

This report may contain a short-term trading idea or recommendation, which highlights a specific near-term catalyst or event impacting the issuer or the market that is anticipated to have a short-term price impact on the equity securities of the issuer. Short-term trading ideas and recommendations are different from and do not affect a stock's fundamental equity rating, which reflects both a longer term total return expectation and attractiveness for investment relative to other stocks within its Coverage Cluster. Short-term trading ideas and recommendations may be more or less positive than a stock's fundamental equity rating.

BofA Securities is aware that the implementation of the ideas expressed in this report may depend upon an investor's ability to "short" securities or other financial instruments and that such action may be limited by regulations prohibiting or restricting "shortselling" in many jurisdictions. Investors are urged to seek advice regarding the applicability of such regulations prior to executing any short idea contained in this report.

Foreign currency rates of exchange may adversely affect the value, price or income of any security or financial instrument mentioned herein. Investors in such securities and instruments, including ADRs, effectively assume currency risk.

BofAS or one of its affiliates is a regular issuer of traded financial instruments linked to securities that may have been recommended in this report. BofAS or one of its affiliates may, at any time, hold a trading position (long or short) in the securities and financial instruments discussed in this report.

BofA Securities, through business units other than BofA Global Research, may have issued and may in the future issue trading ideas or recommendations that are inconsistent with, and reach different conclusions from, the information presented herein. Such ideas or recommendations may reflect different time frames, assumptions, views and analytical methods of the persons who prepared them, and BofA Securities is under no obligation to ensure that such other trading ideas or recommendations are brought to the attention of any recipient of this information. In the event that the recipient received this information pursuant to a contract between the recipient and BofAS for the provision of research services for a separate fee, and in connection therewith BofAS may be deemed to be acting as an investment adviser, such status relates, if at all, solely to the person with whom BofAS has contracted directly and does not extend beyond the delivery of this report (unless otherwise agreed specifically in writing by BofAS). If such recipient uses the services of BofAS in connection with the sale or purchase of a security referred to herein, BofAS may act as principal for its own account or as agent for another person. BofAS is and continues to act solely as a broker-dealer in connection with the execution of any transactions, including transactions in any securities referred to herein.

BofA ESGMeter Methodology:

ESGMeter is a proprietary metric based on quantitative analysis and fundamental analyst inputs that reflects our assessment of a company's Environmental, Social and Governance-related attributes. The ESGMeter is intended to indicate a company's likelihood of experiencing stronger financial stability (higher return on equity and lower earnings and price volatility) over the next three years relative to peer group. There are three ESGMeter levels - Low, Medium, and High - which indicate whether a company has attributes most likely to translate into superior financial stability (in the case of a High level) or weaker financial stability (in the case of a Low level) over the next three years relative to its peer group. A Medium level suggests that a company exhibits ESG characteristics that are likely associated with financial stability results in line with its peer group over the next three years. Full details of our methodology, financial stability definition and disclaimers are available at BofA ESGMeter methodology. ESGMeter is not indicative of a company's future stock price performance and is not an investment recommendation or rating. ESGMeter is independent of the BofA Global Research fundamental equity analyst's investment rating, volatility risk rating, income rating or price objective for that company.

Subject to the quiet period applicable under laws of the various jurisdictions in which we distribute research reports and other legal and BofA Securities policy-related restrictions on the publication of research reports, fundamental equity reports are produced on a regular basis as necessary to keep the investment recommendation current.

Certain outstanding reports or investment opinions relating to securities, financial instruments and/or issuers may no longer be current. Always refer to the most recent research report relating to an issuer prior to making an investment decision.

In some cases, an issuer may be classified as Restricted or may be Under Review or Extended Review. In each case, investors should consider any investment opinion relating to such issuer (or its security and/or financial instruments) to be suspended or withdrawn and should not rely on the analyses and investment opinion(s) pertaining to such issuer (or its securities and/or financial instruments) nor should the analyses or opinion(s) be considered a solicitation of any kind. Sales persons and financial advisors affiliated with BofAS or any of its affiliates may not solicit purchases of securities or financial instruments that are Restricted or Under Review and may only solicit securities under Extended Review in accordance with firm policies.

Neither BofA Securities nor any officer or employee of BofA Securities accepts any liability whatsoever for any direct, indirect or consequential damages or losses arising from any use of this information.
